ABOUT BLADDER CANCER

The bladder is located in the pelvis. It collects and stores urine and has a muscular wall that allows it to contract and expand. Cancer that is only in the lining of the bladder is called non-muscle invasive bladder cancer (NMIBC). This type of cancer is sometimes called superficial bladder cancer. More than 70% of bladder cancer is diagnosed as a NMIBC and it has an excellent survival rate.

Muscle invasive bladder cancer invades the layers of muscles in the bladder and is more likely to spread to other parts of the body but is often still quite curable.

TREATING BLADDER CANCER

Treatment options are based on your type of cancer, age and overall health. Bladder cancer, if caught early, can often be cured. The main treatments are:

- Surgery
- Biologic therapy
- Chemotherapy
- Radiation therapy
- Immunotherapy

These treatments may be used alone or in combination. The type of treatment and the combination of treatments used depend on your specific tumor and your age and overall health.

TREATMENT OPTIONS

Surgery

Surgery is used to remove tumors from the bladder. A U.S. study found that the use of a robotic surgical approach allows many patients to urinate normally rather than sometimes being able to treat the cancer while preserving the bladder. This organ-preserving approach allows many patients to urinate normally rather than requiring surgical reconstruction for urinary function.

RADIATION THERAPY FOR BLADDER CANCER

Radiation therapy, sometimes called radiotherapy, is the careful use of radiation to safely and effectively treat cancer. Radiation therapy works within cancer cells by damaging their ability to multiply. When these cells die, the body naturally eliminates them. Healthy cells are also affected by radiation, but they are able to repair themselves in a way cancer cells cannot.

External beam radiation therapy is the main type of radiation used to treat bladder cancer, often in combination with chemotherapy. During this treatment, radiation is directed at the tumor from a machine similar to an X-ray machine.

EXTERNAL BEAM RADIATION THERAPY

External beam radiation therapy involves a series of daily treatments to accurately deliver radiation to the bladder and pelvis. Research trials have shown that radiation and chemotherapy can permit some bladder cancer patients to have organ-preserving treatment that doesn’t require complete removal of the bladder.

Before treatment begins, your treatment plan will be designed. A CT scan is done while you are in the position you will be in when treated. Often a supportive device is used to keep you comfortably in the same position for treatment. Your radiation oncologist may ask you to have a full or empty bladder for this scan. You may receive two scans (one with a full bladder and one with an empty bladder) to see the changes in your bladder volume. Using information from your pathology, imaging and exam, your doctor will design a treatment plan to treat the bladder and pelvis.

With external beam therapy, treatment is delivered in a series of daily sessions, Monday through Friday, for several weeks. Each day, you will feel the same when you leave as you did when you came. The radiation beam is usually generated by a machine called a linear accelerator, or linac. Doctors use this machine to generate high-energy X-rays to treat your cancer.

Three-dimensional conformal radiotherapy (3-D CRT) combines multiple radiation treatment fields to deliver precise doses of radiation to the cancer. This technique helps keep radiation away from nearby healthy tissue.

Intensity-modulated radiation therapy, or IMRT, is a specialized form of 3-D CRT that allows the radiation beam to be shaped to focus on the tumor. IMRT may be necessary depending on the anatomy, what areas need to be treated and the need to protect healthy organs.

CAREING FOR YOURSELF DURING TREATMENT

- Get plenty of rest during treatment. Follow your doctor’s orders.
- Ask if you have questions about your treatments and side effects.
- Tell your doctor about any medications, including over the counter medications or vitamins you are taking.
- Eat a balanced diet. If food tastes funny or if you’re having trouble eating, tell your doctor or dietitian. They may be able to help you change the way you eat.
- Treat the skin exposed to radiation with special care. Avoid hot or cold packs, and only use lotions and ointments after checking with your doctor or nurse. Your radiation oncology team may also recommend special creams.

Radiation Therapy for
Bladder Cancers

The American Cancer Society estimates that approximately 81,000 Americans (62,000 men and 19,000 women) will be diagnosed with bladder cancer this year and nearly 18,000 will die of the disease. Bladder cancer is four times more common in men than in women. It is two times more common in white men than black men.

### ABOUT THE RADIATION ONCOLOGY TEAM
Radiation oncologists are doctors who specialize in the use of radiation therapy as a treatment for cancer. Other members of the treatment team include radiation therapists, radiation oncology nurses, medical physicists, dosimetrists, social workers and nutritionists. For information on what each does or to find a radiation oncologist near you, visit [www.rtanswers.org](http://www.rtanswers.org).

### ABOUT ASTRO
The American Society for Radiation Oncology is the largest radiation oncology society in the world with more than 10,000 members who specialize in treating patients with radiation therapies. ASTRO is dedicated to improving patient care through education, clinical practice, advancement of science and advocacy. Visit [www.astro.org](http://www.astro.org) for more information.

### POSSIBLE SIDE EFFECTS
